

Defect Log

Team 20

Shivan Desai, Adam Johnston, Akhil Agrawal, Brian Duffy

Defect #	Defect Description	Severity	Test Case # or Description
1.	When you login, you are directed to the homepage. When you log out, the page still shows information that should only be visible to those who are currently logged in.	2	Test Case 19
2.	When you click an image of one of the events it redirects you to the account information page.	2	Test Cases 6, 7, 8: All of these test cases mention clicking on an event box and being taken to the event page. While there is no specific test case for whether or not you click the image or the text in the event box, it is somewhat covered by the mention of clicking an event box and being redirected to the event's corresponding page.
3.	In the report a problem, the email doesn't allow letters only numbers despite saying the input should not contain any numbers.	1	Test Case 20: This test case sort of handles it, although an equivalence test case would have been a better fit in hindsight.
4.	When I hit clear for the report a problem, a dialog message popped up saying the report was sent when I didn't enter any information.	2	Test Case 20
5.	In the report a problem page, the submit button functions as the clear button.	2	Test Case 20

6.	The invite a friend email sent sends a localhost link to follow and not an accessible web address.	1	Test Case 18
7.	The invite a friend clear button doesn't clear the email input field.	2	Test Case 18: With the addition of checking for clear functionality similar to Test Case 4.
8.	A user's date of birth can be in the future, can be -1,-1,-1, and other nonsensical dates.	3	Test Case 21, 22
9.	The invite a friend submit button claims to have sent an email but no email was provided.	2	Test Case 18
10.	After creating an organized meeting, two meetings are created. One is from the view of the creator of the meeting the other is from a user of the app who did not create that meeting.	1	Test Case 14
11.	Once a creator cancels a meeting they cannot delete the copy of that meeting from the home page.	1	We did not have a cancel event test case. This particular defect is a continuation of the 10th bug found where a copy of a created event is made.
12.	On the create a rally page, the upload a picture button does not work.	3	Test Case 14
13.	On the create a rally page, the tags button does not allow users to enter in tags for a rally.	3	Test Case 14 Tags were not specifically mentioned in the test case however, so it should be modified to account for this.
14.	When editing a created rally, the creator cannot rename the rally despite there being documented behavior for doing so.	2	We did not make a test case for editing a rally, although it would be very similar to the create a rally test case (Test Case 14)

15.	After creating a rally, the creator can register to their own rally despite documents saying that this should not happen.	2	Test Case 6 However, it does not cover the creator of the event registering for the event, so should be modified to account for this.
16.	In the premade rallies a user can register to the rally. When they go to see their registered meets, they cannot see how many registered users there are in total like the documentation says should happen.	3	Test Case 6: We left out the specifics of users being able to see how many other users are registered to a given event.
17.	Upon successful creation of a meet, the user is not redirected to the organized meetings page like the documentation states will happen.	3	Test Case 14
18.	Upon refresh of the web page after logging in successfully, the user must login again. (none of my login credentials saved)	3	Refreshing the page was something that was not taken into account for this. This would be a functionality test case testing how information is stored upon refresh.
19.	A user can create a rally in the past.	3	Test Case 14: More specifically error validation for date entry.
20.	When a user clicks forgot password button and they don't enter any email address and they click submit a confirmation dialog pops up saying an email was sent.	3	Test Case 3
21.	A user does not need to type in the confirmation password when registering an account.	1	Test Case 21
22.	A user can enter less than the minimum characters in the password which should be 8.	1	Test Case 21

23.	A user can edit a rally's time to be letters.	2	We did not make a boundary test case for editing a rally. But it would be similar to Test Case 14. With letters as input for numeric values.
24.	When editing event information, if a user clicks cancel and then clicks to edit the same event again, they end up editing information for the next event. This continues until the editing of an event reaches the last event.	1	We did not make a test case for editing a rally. This would be a functionality test where if the user pressed edit an event on that specific event, it would take them to the edit event page of that specific event.
25.	On the register page, the clear button only removes the username and date of birth.	2	Test Case 4
26.	On the account information page you can edit fields like date of birth to be all letters.	2	Test Case 22: In addition to checking times, we also checked for characters where only numbers should allowed. Note: This defect is similar to #8, although it happens on the edit account information page.
27.	On the account information page the delete account button logs the user out and removes their email, date of birth, and their username. It doesn't actually delete the account. The user can still log in.	1	Test case 10
28.	On the donation page, a user can donate a blank amount of money	3	Test Case 16
29.	On the donation page, a user can donate a non-numerical amount of money	3	Test Case 16
30.	Pressing enter on the donation page instead of clicking the paypal button causes a 404 error	3	Test Case 15
